Introduction

Introduction: "Refuge" areas

Geography shapes language, in this case in the specific sense that altitude predicts aspects of sociolinguistics, grammatical complexity, and areality [...]

Of course, altitude is not the direct and proximate cause for these things. For instance, isolation favors (or at least does not disfavor) complexity, [...]

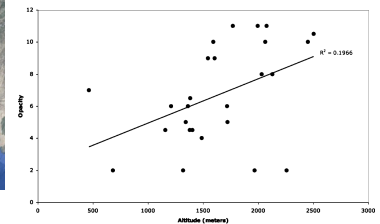

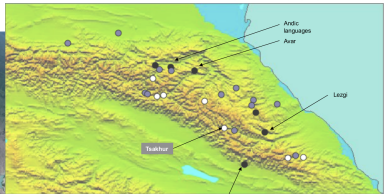

Nichols (2013). The vertical archipelago: Adding the third dimension to linguistic geography.

Bickel & Nichols (2003). Typological enclaves.

Introduction: Altitude

$N = 27$. Black = most transparent, white = least. Labels: major contact languages (present or former)

Nichols (2016). Complex edges, transparent frontiers. Grammatical complexity and language spreads.

Morphological Complexity Measures

Morphological Complexity Measures

- Inventory complexity prepared by Johanna Nichols (Nichols Compl.)
- Inventory complexity based on WALS (WALS Compl.)
- Unigram word entropy in parallel texts (Unigram H)

Haspelmath & Dryer (eds.) (2013). The World Atlas of Language Structures Online.

Inventory Complexity (Nichols)

Sum of values for 8 morphological features

Feature	Value
Inflectional synthesis	3 to 14
Noun plural	0 = absent, 1 = present
Noun dual	0 = absent, 1 = present
Numeral classifiers	0 = absent, 1 = present
Possessive classification	1 = none, 2 = few, 3 = many
Gender	0 = absent, 1 = present
Auto-gender (on nouns)	0 = absent, 1 = present
Inclusive/exclusive distinction	0 = absent, 1 = present

Note: only languages are included for which all features are available

Inventory Complexity (WALS)

Mean value of up to 28 morphological features

Feature	Value
Number of case markers	1 to 8 (no case to 10 or more)
Future tense	0 = absent, 1 = present
Number of genders	1 to 5 (none to five or more)
Coding of Nominal Plurality	0 = absent, 1 = present
...	...

Note: only languages are included for which more than 10 features are available

Bentz, Ruzsics, Koplenig & Samardžić (2016). A comparison between morphological complexity measures: typological data vs. language corpora.

(1) Kayardild

Ngada maarra junku-ru-thu,
I only right-FACTITIVE-POTENTIAL,
thaku-ru-nangku
left-FACTITIVE-NEGATIVE.POTENTIAL

"I will only make things correct, I will not twist or distort
anything"

Evans (2010). Dying words: endangered languages and what they have to tell us. p. xxi.

*As you can see, the Kayardild version **compresses** two English sentences into just four words.*

Evans (2010). Dying words: endangered languages and what they have to tell us. p. xxi.

(2) Hawaiian (haw)

A ua olelo aku o Ioane ia ia [...]
Then PERF say to SUBJ Johan he.DAT [...]

"Then Johan said to him [...]"

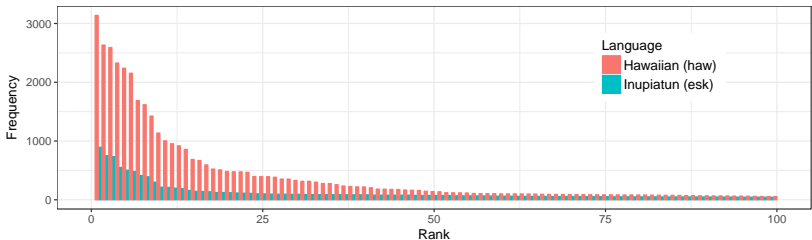

(3) Iñupiatun (esk)

Aglaan Jesus-ŋum itna-ġ-ni-ġai [...]
But Jesus-ERG this-say-report-3S.to.3PL

"But Jesus said to them [...]"

Mayer & Cysouw (2014). Creating a massively parallel bible corpus.

Unigram Word Entropy

$$H(T^{haw}) \sim 7 \text{ bits/unigram}$$

$$H(T^{esk}) \sim 13 \text{ bits/unigram}$$

Shannon (1948)

Bentz, Alikaniotis, Cysouw & Ferrer-i-Cancho (2017). The entropy of words — learnability and expressivity across more than 1000 languages.

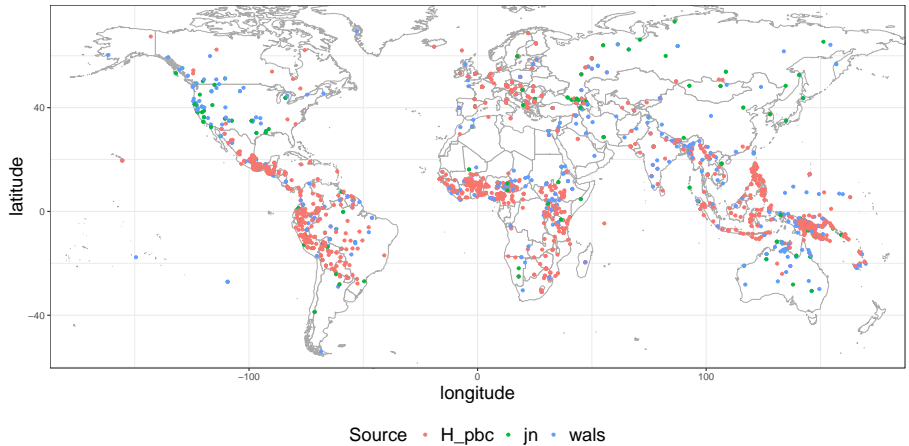

Data

Table 1: Three data samples used for statistical analyses.

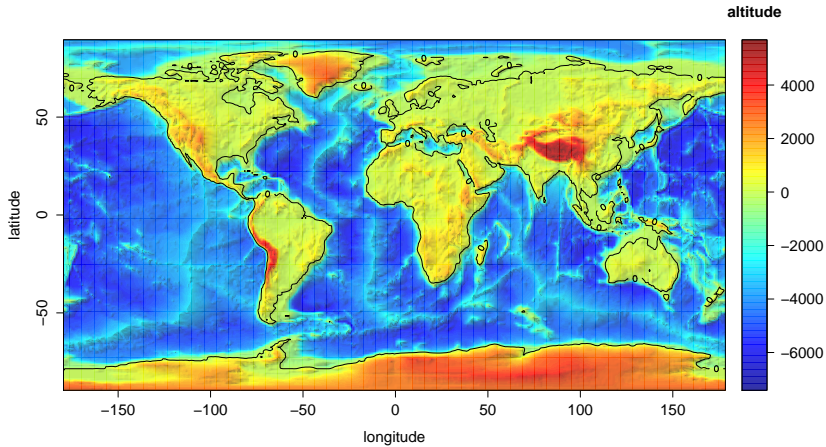

Sample	Data points	Lang. (ISO)	Families ¹	Areas
Unigram H (PBC)	1432	1071	100	6
Nichols (JN)	183	183	84	6
WALS	468	465	112	6
Total	2083	1380	152	6

¹ Families and macro areas from Glottolog 2.7 (Hammarström et al. 2016)

$$\hat{H}(\text{nld}) \approx -0.2$$

$$\hat{H}(\text{eng}) \approx -0.6$$

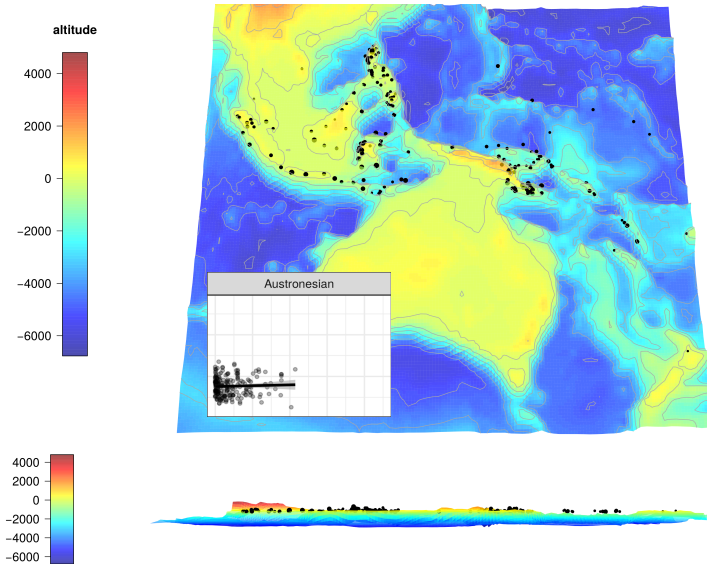

South America

Africa

Austronesian

Conclusion

- There is a world wide effect **higher altitude → higher complexity**, reflected in WALS complexity and unigram entropy, but not for Nichols' complexity (sample size?)
- For WALS this is maintained in a mixed-effects model controlling for family and area variation, but not in a finer-grained phylogenetic regression
- For unigram entropy the effect is robust at all levels of phylogenetic and areal controls

Thank You
